

BEYOND PREDICTIVE MAINTENANCE.....

Failure prediction of rotating equipment is only one factor in the equation for more efficient and productive maintenance improvement programs. Corrective action --- finding a cure for chronic equipment breakdown, is vital to the overall strategy.

Maintenance cost avoidance should be the ultimate operative goal. It doesn't make much sense to renew or replace critical rotating equipment to the same specifications that allowed it to fail in the first place. Don't expect different results while using the same old maintenance methods.

The Inpro/Seal® Bearing Isolator should be an integral part of your reliability enhancement effort. Retrofit or OEM on pumps, motors, gears, turbines, and many other types of rotating equipment. Inpro/Seal® is a permanent replacement for contact seals that consume power and wear out in a matter of months.

If permanent, near perfect lubrication of your rotating equipment bearings would improve your plant's performance and reliability, then Inpro/Seal® Company will be able to help.
